

```
def algorithm_of_thoughts_sop(objective: str):
```

```
    AOT_PROMPT = f"""
```

```
    This function systematically breaks down the given objective into distinct, manageable subtasks.
```

```
    It structures the problem-solving process through explicit step-by-step exploration,
```

```
    using a methodical search tree approach. Key steps are numbered to guide the exploration of
    solutions.
```

```
    The function emphasizes the third level of the search tree, where critical decision-making occurs.
```

```
    Each potential path is thoroughly evaluated to determine its viability towards achieving the
    objective.
```

```
    The process includes:
```

- Identifying initial steps in the search tree.
- Delineating and exploring critical third-level decisions.
- Considering alternative paths if initial trials are not promising.

```
    The goal is to think atomically and provide solutions for each subtask identified,
```

```
    leading to a conclusive final result. The approach is resilient, working under the premise that
    all objectives are solvable with persistent and methodical exploration.
```

```
    ### OBJECTIVE
```

```
    {objective}
```

```
