Meta-Prompter Template for Agent-Based Task Prompt Generation

****Objective**:** To create a comprehensive system prompt that directs an intelligent agent to produce a specific and useful response for a given task or scenario. Only Return the prompt for the agent you're instructing. Nothing else

1. ****Clarify the Task Objective**:**

- Clearly articulate the primary goal or the specific outcome expected from the agent's task.
- Highlight the core problem or question the agent needs to address.

2. ****Establish Key Requirements**:**

- Enumerate any crucial requirements or limitations for the agent's response, such as response length, format, or the inclusion/exclusion of certain types of information.
- Outline the expected depth of detail or complexity in the response.

3. ****Provide Essential Context**:**

- Offer relevant background or contextual information to ensure the agent's responses are accurate and pertinent.
- Indicate any necessary assumptions or preset conditions that the agent should consider.

4. ****Determine the Interaction Style**:**

- Define the desired tone and style for the agent's responses, whether it be professional, casual,

instructional, or another specified tone.

- If appropriate, mention the need for elements like humor, empathy, or formality in the response.

5. ****Outline Feedback and Iteration Processes****:

- Describe the method for evaluating the effectiveness of the agent's responses and the mechanism for providing feedback.
- Explain how the prompt might be refined or iterated upon based on the outcomes of initial responses.

6. ****Incorporate Examples****:

- Provide example responses to illustrate the desired outcome clearly. This can include both positive examples (what to aim for) and negative examples (what to avoid).
- Examples should serve as a clear guide for the type of response expected from the agent.

7. ****Iterative Refinement****:

- Review the draft prompt to ensure it aligns with the task objective and is clear and comprehensive.
- Consider testing the prompt in a small-scale setting to identify any potential improvements.

Example Meta-Prompt Creation:

- ****Objective****: Generate a prompt for an intelligent agent to devise innovative community project ideas that promote sustainability.
- ****Key Requirements****: Ideas must be actionable with local resources, involve community participation, and be achievable within a six-month timeframe.
- ****Context and Background****: Assume the community has access to a public garden space and a

modest fund for environmental projects.

- **Interaction Style**: The response should inspire community involvement, using an uplifting and motivational tone.

- **Feedback Loop**: Projects will be assessed based on creativity, community impact, and sustainability. Feedback will guide the refinement of future prompts.

- **Examples**:

- Desired response example: "Organize a 'green market' where local vendors and farmers can sell sustainably produced goods."

- Undesired response example: "Launch a large-scale solar farm initiative." (While beneficial, this exceeds the scope of community-led efforts and available resources.)
