

# DistilWhisperModel Documentation

## Overview

The `DistilWhisperModel` is a Python class designed to handle English speech recognition tasks. It leverages the capabilities of the Whisper model, which is fine-tuned for speech-to-text processes. It is designed for both synchronous and asynchronous transcription of audio inputs, offering flexibility for real-time applications or batch processing.

## Installation

Before you can use `DistilWhisperModel`, ensure you have the required libraries installed:

```
```sh
pip3 install --upgrade swarms
```
```

## Initialization

The `DistilWhisperModel` class is initialized with the following parameters:

| Parameter             | Type             | Description                                      | Default                                       |
|-----------------------|------------------|--|---|
| <code>model_id</code> | <code>str</code> | The identifier for the pre-trained Whisper model | <code>"distil-whisper/distil-large-v2"</code> |

Example of initialization:

```
```python
from swarm_models import DistilWhisperModel

# Initialize with default model

model_wrapper = DistilWhisperModel()

# Initialize with a specific model ID

model_wrapper = DistilWhisperModel(model_id="distil-whisper/distil-large-v2")
```
```

## ## Attributes

After initialization, the `DistilWhisperModel` has several attributes:

| Attribute         | Type                         | Description  |
|-------------------|------------------------------|--|
| ----- ----- ----- |                              |  |
| `device`          | `str`                        | The device used for computation (`"cuda:0"` for GPU or `"cpu"`). |
| `torch_dtype`     | `torch.dtype`                | The data type used for the Torch tensors.                        |
| `model_id`        | `str`                        | The model identifier string.                                     |
| `model`           | `torch.nn.Module`            | The actual Whisper model loaded from the identifier.             |
| `processor`       | `transformers.AutoProcessor` | The processor for handling input data.                           |

## ## Methods

```
### `transcribe`
```

Transcribes audio input synchronously.

**\*\*Arguments\*\*:**

| Argument | Type             | Description                         |
|----------|------------------|-------------------------------------|
| inputs   | Union[str, dict] | File path or audio data dictionary. |

**\*\*Returns\*\*:** str - The transcribed text.

**\*\*Usage Example\*\*:**

```
python
# Synchronous transcription
transcription = model_wrapper.transcribe("path/to/audio.mp3")
print(transcription)
```

### `async\_transcribe`

Transcribes audio input asynchronously.

**\*\*Arguments\*\*:**

| Argument | Type | Description |
|----------|------|-------------|
|----------|------|-------------|

|-----|-----|-----|

| `inputs` | `Union[str, dict]` | File path or audio data dictionary. |

**\*\*Returns\*\*:** `Coroutine` - A coroutine that when awaited, returns the transcribed text.

**\*\*Usage Example\*\*:**

```
```python
```

```
import asyncio
```

```
# Asynchronous transcription
```

```
transcription = asyncio.run(model_wrapper.async_transcribe("path/to/audio.mp3"))
```

```
print(transcription)
```

```
```
```

### `real\_time\_transcribe`

Simulates real-time transcription of an audio file.

**\*\*Arguments\*\*:**

| Argument | Type | Description |
|----------|------|-------------|
|----------|------|-------------|

|-----|-----|-----|

|                   |       |                         |
|-------------------|-------|-------------------------|
| `audio_file_path` | `str` | Path to the audio file. |
|-------------------|-------|-------------------------|

|                  |       |                                      |
|------------------|-------|--------------------------------------|
| `chunk_duration` | `int` | Duration of audio chunks in seconds. |
|------------------|-------|--------------------------------------|

**\*\*Usage Example\*\*:**

```
```python
```

```
# Real-time transcription simulation
```

```
model_wrapper.real_time_transcribe("path/to/audio.mp3", chunk_duration=5)
```

```
```
```

## ## Error Handling

The `DistilWhisperModel` class incorporates error handling for file not found errors and generic exceptions during the transcription process. If a non-recoverable exception is raised, it is printed to the console in red to indicate failure.

## ## Conclusion

The `DistilWhisperModel` offers a convenient interface to the powerful Whisper model for speech recognition. Its design supports both batch and real-time transcription, catering to different application needs. The class's error handling and retry logic make it robust for real-world applications.

## ## Additional Notes

- Ensure you have appropriate permissions to read audio files when using file paths.
- Transcription quality depends on the audio quality and the Whisper model's performance on your dataset.
- Adjust `chunk_duration` according to the processing power of your system for real-time

transcription.
